

Introduction to the Theory of Sound Transmission With Application to the Ocean

C. B. Officer
Published 1958

Contents

Chapter 1. Fundamental Relations

Components of Stress
Components of Strain
Stress-Strain Relations
Equations of Motion
Fundamental Solution of the Wave Equation

Adiabatic and Isothermal Condition and the
Velocity of Sound in Sea Water
Relations for Energy, Energy Density, Energy
Flow, and Intensity in Terms of Density,
Pressure, and Particle Velocity
Relations for Particle Displacement, Particle
Velocity, Dilatation, and Stress in Terms
of Velocity and Displacement Potential
Unit of Measurement of Intensity, the Decibel

Waves of Finite Amplitude
Shock Fronts

Chapter 2. General Theory

Development of Solution in Terms of Rays
Ray Characteristics for Velocity a Function of One
Space Coordinate Only
Ray Characteristics for a Constant Velocity Gradient

Development of Solution in Terms of Normal Modes
Normal-mode Solution in Problems with More Complicated
Wave Equations
Refraction of a Dispersive Wave Train

Boundary Conditions

Chapter 3. Transmission in Shallow Water

Ray Solution
Reflection of a Pulse
Surface Image Interference
Normal Incidence to One and Two Boundaries
Normal-mode Solution

Chapter 4. Transmission in Deep Water

Ray Solution
Normal-mode Solution
Near-surface Transmission, Negative Velocity Gradient
Near-Surface Transmission, Positive Velocity Gradient
Overlying a Negative Gradient

Chapter 5. Reflectivity

Formal Solution, Point Source in the Vicinity of a Plane
Boundary
Evaluation of the Resultant Integral in the Limit of High
Frequencies
Evaluation of the Resultant Integral for Long Ranges and
for $c_2 > c_1$
Evaluation of the Branch-line Integral from the Normal-mode
Solution of Chap. 3

Normal Incidence to a Rapid Change in Velocity
Reflection from an Elastic Medium
Normal Incidence to a Corrugated Boundary
Reflection from a Porous Medium
Reflection from a Boundary for Which the Boundary Condition
is Continuity of Acoustic Impedance

Reflection from Three Layers
Horizontal Coupling to a Wave Guide

Interpretation of Echo Sounding Records
Interpretation of Geophysical Reflection and Refraction Profiles

Chapter 6. Attenuation

Absorption, Viscous Fluid
Absorption, Heat Conduction
Propagation in a Porous Medium

General Theory for Scattering and Diffraction
Scattering from a Small Object
Diffraction
Reception to a Linear Array

Index

Preface

It has been my intention in this book to give an introduction to the theory of sound transmission. One might consider any acoustic problem as consisting of some sort of source, transmission, and reception. The transmission itself is, of course, an important and integral part of the whole; this is the portion which is covered here. The level of the book is commensurate with that of a senior undergraduate-first-year graduate course. I have attempted to give the theory in such a manner and to such a degree that following this a reader might feel at ease with the published literature in the field. My specific applications of the theory have been to a description of sound transmission in the ocean. Wherever possible I have given the physical explanations of the theoretical results; this I feel is an important part of a thorough understanding of the theory.

I hope that the book may be of interest to those engaged in various aspects of acoustics and geophysics and particularly to those who are entering into or desire to become acquainted with this subject.

The mathematics involved in the various derivations have been carried through in some detail. For those problems involving the evaluation of integrals, the integrals have been reduced to a familiar form or to a convenient tabulated form. On the other hand, no theory or proof of the various mathematical concepts that are used, such as Fourier integrals, is given. On this account the reader may wish to refer to or study an appropriate mathematics text from time to time.

References to the pertinent books and journal articles are covered in a particular chapter are given at the end of the chapter. Specific reference within each chapter has been avoided. Of the more recent theoretical developments, however, special mention should be given to C. L. Pekeris for the normal-mode type of solution. Only general mention is given to experimental work. This has been intentional.

I should like to express by thanks to the Rice Institute and the Woods Hole Oceanographic Institution for their generous policy of allowing an individual to follow the pursuits of his interest and to the Office of Naval Research and the Bureau of Ships, U. S. Navy,

who have encouraged and supported in a number of ways the preparation of this book. I should also like to acknowledge the discussions that I have had at various times with Drs. J. B. Hersey, and A. D. Voorhis and Mr. A. C. Vine, Woods Hole Oceanographic Institution; Profs. M. Ewing, J. Nafe, and J. L. Worzel and Messrs. J. I. Ewing and G. H. Sutton, Lamont Geological Observatory, Columbia University; Prof. F. Press, Seismological Laboratory, California Institute of Technology, Drs. R. Frosch, and I. Tolstoy, Hudson Laboratories, Columbia University; and Dr. E. T. Miller, Houston Research Center, Humble Oil CO., on matters pertinent to this book. Messrs D. G. Harkrider, T. W. Lawhorn, and D. E. Miller, graduate students at the Rice Institute, have critically examined portions of the material covered in this book.
